

Safety Sleeve Post Protector Installation Instructions

SUMMARY: Bollard posts are widely used to protect utility boxes, warehouse aisles, pedestrian walkways and shopping center entrances. Using our Safety Sleeve Post Protectors minimizes scratches, dents and other damage. Cost effective and long lasting, our bollard post sleeves are made with UV protected polyethylene material to help resist against the degrading effects of direct sunlight guaranteeing years of service.

1. Slide the Safety Sleeve Post Protector over existing bollard post to check fit. The Post Protector inside diameter is always bigger than the listed size. For example, a 6-inch Post Protector has an actual inside diameter of seven (7) inches.
2. Apply the neoprene adhesive tape (included) approximately three (3) inches down from the top of the post and three (3) inches up from the bottom of the post. If a tighter fit is needed, slightly overlap the tape directly underneath the existing tape. Use one continuous piece of tape. Tape length will vary according to post diameter.
3. With a twisting motion, slowly slide the Safety Sleeve Post Protector over the existing bollard post. If this is done correctly, you should hear air seeping out between the bollard post and the bollard post safety sleeve.

If the above directions are followed correctly, the Safety Sleeve Post Protector should fit tightly with no gap between the bollard post and the safety sleeve. Once installed, the Safety Sleeve Post Protector will not be easily removed.
